Ideation Phase
Empathize & Discover

Date	7 October 2026
Team ID	
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	4 Marks

Empathy Map Canvas:

An empathy map is a simple, easy-to-digest visual that captures knowledge about a user's behaviours and attitudes.

It is a useful tool to help teams better understand their users.

Creating an effective solution requires understanding the true problem and the person who is experiencing it. The exercise of creating the map helps participants consider things from the user's perspective along with his or her goals and challenges.

Example: Script-Controlled ACL – Restrict Record Access Based on Field Value

User persona: ServiceNow Administrator / Security Officer who must make sure that sensitive records (for example, incidents marked Confidential) are visible only to the right people.

SAYS	**THINKS**
"Why can everyone with the itil role open this confidential record?" "Role-based access alone is not enough for us." "Access should depend on the value of a field on the record."	Is a script-based ACL safe and easy to maintain? What if the script is wrong and blocks valid users? I need a rule that is simple to test and audit.
DOES	FEELS
Creates roles and groups for each department Adds Business Rules and Query Rules as workarounds Manually checks who can see which record Reads ACL documentation and tests with impersonation	Worried about data leakage and audit findings Frustrated by too many roles to manage Confident when access is controlled by one clear script Relieved when unauthorised users cannot see the record

PAINS	**GAINS**
Sensitive records visible to unauthorised users Role-only ACLs cannot check field values	Record access restricted automatically based on a field value (e.g., Sensitivity = Confidential)

Many roles and rules are hard to maintain Hard to prove compliance during audits	Fewer roles to maintain Consistent security across list, form and reports Easy auditing and testing of one scripted ACL
